

Smart Service Canvas – MedTrack

After Poeppelbuß & Durst (2019) — three perspectives (Customer / Value / Ecosystem), their Fit, and the relevant contexts.

Customer Perspective	Value Perspective	Ecosystem Perspective			
Customer & Job-to-be-done - Senior patient (e.g. Mária, 74): take the right medication at the right time, every day - Caregiver / family (e.g. Hanka, 35): know remotely whether the dose was taken Pains - Forgetting doses / double-dosing - Fiddly small buttons, complex menus, poor eyesight - Caregiver anxiety & constant phone calls Gains - Reliable adherence & independence - Effortless, one-step confirmation - Reassurance and peace of mind for family	Value Proposition - The senior never has to use the app — caregivers set up & monitor; the senior only does one simple physical step - Lower the effort & dexterity needed to record a dose to near-zero Pain relievers - Three confirmation paths: in-app tap, NFC tag, hardware button - Large high-contrast UI; status by colour + icon + text - Forgiving reminders & confirmation windows Gain creators - Adherence rate + streak tracking - Dispenser releases exactly one pill; LED + buzzer feedback - Read-only caregiver view; works offline	Value network / actors - Patient, caregiver, MedTrack app, DoseBuddy device - Cloud backend, Open Data drug source - Pharmacies, retirement / nursing homes, doctors Data sources - Dose events, schedules, adherence history - Device telemetry (battery, remaining doses) - External drug reference / interaction data (Open Data) IT infrastructure & revenue - Flutter clients, cloud Auth + database (reactive) - BLE to ESP32-C3 firmware, NFC, local notifications - Freemium app + hardware sales + B2B licensing			
Fit Every customer pain maps to a concrete reliever: dexterity → one-step confirmation paths; forgetting → reminders + dispenser; caregiver anxiety → remote read-only monitoring. The technical architecture (cloud + BLE + NFC + notifications) exists specifically to make low-effort confirmation and remote oversight possible.					
Key Contexts <table><tr><td> Situational context Time of day & schedule drive reminders and the confirmation window logic. </td><td> Data-in-context A button press / NFC tap is resolved to the correct medication slot using time + schedule, recorded once via a single source of truth. </td><td> Ecosystem context The caregiver link extends the service into a family / care network — read-only, preserving the patient's autonomy. </td></tr></table>			Situational context Time of day & schedule drive reminders and the confirmation window logic.	Data-in-context A button press / NFC tap is resolved to the correct medication slot using time + schedule, recorded once via a single source of truth.	Ecosystem context The caregiver link extends the service into a family / care network — read-only, preserving the patient's autonomy.
